

Slide Outline + Talking Points — Claude Code on Windows (30 min)

8 slides. ~3-4 min per slide on average. Demo is the longest section.

Slide 1 — Title

Visual: Big title, your name, the date.

Title: Get Claude Code Running on Your Windows Machine — in 30 Minutes **Subtitle:** From zero to "AI is now editing my files"

Talking points:

- Welcome. By the end of this session you'll have an AI assistant that can read your files, edit them, and run things for you.
 - This is hands-on. Open your laptop. We're installing it together.
-

Slide 2 — What is Claude Code (and why should you care)

Visual: Side by side — left: ChatGPT chat window. Right: a terminal with Claude Code editing a file.

One-liner: Claude Code is ChatGPT with hands.

Talking points:

- ChatGPT can talk about your files. Claude Code can actually open, read, and change them.
- Three concrete things it does that chat can't:
 1. Read every file in a folder.
 2. Edit files directly (with your permission).
 3. Run commands and report back.
- Examples for non-devs:
 - "Summarize 50 customer emails in this folder."
 - "Pull dates and dollar amounts out of this contract."

- "Build me a one-page website by tonight."

Slide 3 — The Window You'll Live In

Visual: Screenshot of Windows Terminal with PowerShell open.

Heading: Terminal vs. Shell — what's the difference?

Talking points:

- **Terminal** = the window (the app with tabs).
- **Shell** = the language you type inside it.
- On Windows you have choices. Here's the simple answer:
 - **Use Windows Terminal** as the app — preinstalled on Windows 11.
 - **Use PowerShell** as the shell — Microsoft's modern, supported one.
- What about the alternatives?
 - **CMD** — old. Skip.
 - **Git Bash** — works, but extra install.
 - **WSL2** (real Linux inside Windows) — more powerful, but 30 min of setup. That's a future session.
- For today: Windows Terminal + PowerShell. Already on your machine. Zero extra install.

Slide 4 — Step 1: Install Node.js

Visual: nodejs.org homepage with the LTS download button circled.

Heading: Get the engine

Talking points:

- Claude Code is delivered through "npm" — it ships with Node.js.
- Go to **nodejs.org**.
- Download the **LTS** version (left button, says "LTS").
- Run installer. Click Next on every screen. Defaults are correct.
- Close any open PowerShell windows after install. Open a fresh one.

Verify:

```
node --version  
npm --version
```

Slide 5 — Step 2: Install Claude Code

Visual: A single line of code, big text.

```
npm install -g @anthropic-ai/claude-code
```

Talking points:

- One command. Paste it. Wait 30–60 seconds.
- The `-g` means "global" — you can run `claude` from any folder on your computer.
- Verify: `claude --version`.

Slide 6 — Step 3: Sign In

Visual: Screenshot of the first-run auth screen.

Heading: Two ways to sign in. Pick the easy one.

Talking points:

- Type `claude` in PowerShell. First run shows an auth screen.
- **Option 1 (recommended):** Sign in with your Claude account (uses your Claude.ai Pro subscription).
- **Option 2 (advanced):** Use an API key from console.anthropic.com — pay-per-use. Skip for today.
- Browser opens, log in, click Authorize, tab back. Done.

Slide 7 — LIVE DEMO

Visual: Just a black slide that says "DEMO" — focus moves to your screen.

Talking points:

- Pick the demo from the walkthrough doc that fits your audience.
- Narrate what's happening on screen as Claude works.
- Highlight: "It asked permission before editing." — that's important.

If the demo fails:

- Have a screen recording of a successful run as a backup. Play that.
-

Slide 8 — Where to Go From Here

Visual: Bullet list with icons.

Talking points:

- `/help` inside Claude — explore commands.
- `claude --resume` — continue your last conversation.
- **CLAUDE.md** — drop a file in any folder to teach Claude your preferences.
- **Skills** — pre-built experts for marketing, ads, copywriting, etc.
- **Next session:** WSL2 setup for serious users.

Close with:

"What's the first thing in your work you'd want to hand to Claude?" Collect answers. You just sourced your next session topic.

Speaker notes — overall

- **Don't apologize for the terminal.** Non-devs are nervous about it. Frame it as "just a different kind of window." Confidence transfers.
- **Pause after each command** for ~5 seconds. Let attendees catch up. They will fall behind without it.
- **Use a big font** in PowerShell during the demo (Ctrl+Plus to zoom). Default size is unreadable on a projector.
- **Have water nearby.** 30 min talking is more than you think.
